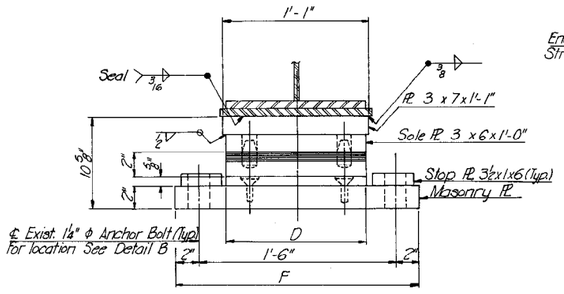
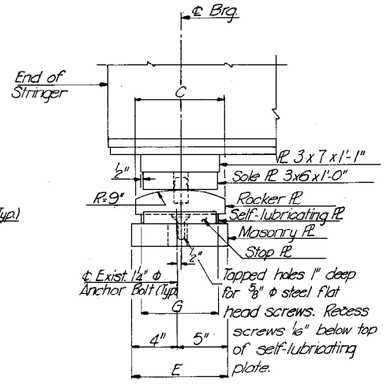
PLAN F6M
Scale: None



DETAIL A (E16)
Scale: None



DETAIL B
Scale: None

Shoe Notes:

Material for shoes (exclusive of self-lubricating plates) shall b high strength, low alloy structural steel conforming to ASTM Specification A-588.

Top of masonry plates, bottom of rocker plates and top and bottom of sole plates shall be planed, straightened or otherwise treated to secure true level surfaces.

Contact surfaces noted on the plans with finish symbols shall be finished in accordance with the American Standards Association surface roughness requirement as defined in ASA B46.1-55, Surface Roughness, Waviness and Lay, Part I.

The plates comprising the expansion shoes shall be set so as to be truly centered under full dead load at a temperture of 60°F.

Concrete pads shall be formed integral with abutment or pier and not less than ⅛" or more than ¼" above finished elevation. Dress down pads by rubbing, grinding or as otherwise approved by the Engineer, to true level surfaces at the finished elevation.

Anchor bolt assemblies shall conform to A.S.T.M. A-307-66 and shall be hot-dip galvanized conforming to A.S.T.M. A-153-66.

Templates shall be used to accurately set the anchor bolts.

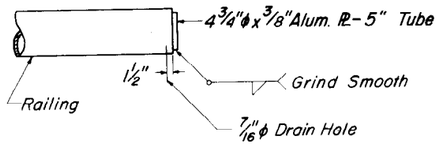
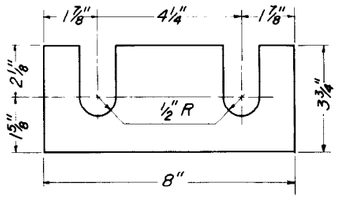
Nuts (Bottom) — ASTM A307
Threads on all rods may be rolled or cut.

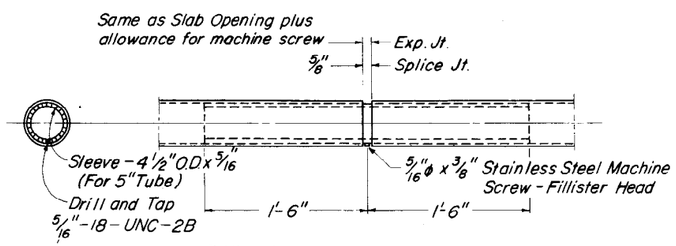


RAIL END CAP



SHIM DETAIL

Shims to be made from 1/16" or 1/8" material. Shims shall not project outside of post base.



RAIL SPLICE & EXP. JOINT

NOTES:
Posts shall be seated on neoprene bearing pads 1/16" minimum thickness, having a nominal durometer hardness of 70. Pads shall conform to post base dimensions.
Aluminum shims may be used for adjusting post alignment, maximum thickness of shim build-up not to exceed 1/8". Where more tilting of the post is required, the concrete area shall be ground down
Posts shall be cast aluminum.
Rail members shall be aluminum extruded tube.
Anchor bolts may be set normal to profile grade.
Bi-metallic anchor rods may be used as an alternate for the stainless steel rods. See Special Provisions.

Material for toggle bolt assembly TBI shall be carbon or stainless steel having a minimum elongation of 12%. Any non stainless component to be either galvanized to ASTM-A153 or cadmium plated to ASTM-A165, Type NS.
Required minimum tensile load to equal 9000 lbs. when in an open position and tested thru a 1"ϕ hole.

GENERAL NOTES FOR DRY STANDPIPE SYSTEM:

1. The Standpipe System shall be fabricated from 4½" O.D. Black Steel Pipe and shall conform to ASTM Specification A53-73, Schedule 80, Grade A. All welded joints shall be full penetration butt welds and shall comply with 1973 A.W.S. Specifications.

2. a. All 60° bends shall be cut from 90° bends. All bends shall conform to the specifications for Black Steel Pipe. All bends shall be long radius or full flow type bends
   b. Couplings shall conform to Victaulic Standard Coupling Style 77 with Grade H gasket for steel pipe, or approved equal.
   c. Pipe hangers shall be fabricated from Mild Carbon Steel ASTM Specification A36. Bolts shall conform to ASTM Specification A325. Pipe hangers shall be welded per plan details and in accordance with the 1973 AWS Specifications.

3. The Standpipe System shall be painted in accordance with the Contract Supplemental Specifications Section 414 Painting of Metal in Structure.

   Section 414.02 shall be modified to read;

   3rd Coat - The exterior coat shall be DuPont Dulux Metal Protective Patina Green, No. 1025-341, or approved equal. Except as follows, The first 8 feet of pipe at the ground level end shall be painted a reflective Silver-White Alert Series 14-40 as manufactured by Cataphote Division, Fero Corp., or approved equal.

4. As each Dry Standpipe System is completed for operation it shall be tested as a wet system at a minimum of 300 psi static pressure for a period of not less than 30 min. If failure occurs the necessary repairs will be made and the testing procedure shall be repeated until the system as a unit is proven sound to the satisfaction of the engineer. After testing and approval by the engineer each system shall be drained, valves closed, caps and plugs replaced and hand tightened. The sill cock located under the siamese fixture shall be left in an open position and keys turned over to the Chief, Bureau of Fire, City of Richmond.

5. Fire Department Connection Fixtures.

   a. Each Standpipe System shall have one 4"x2½"x2½" Double Clapper Siamese Connection, at the ground level end, Powhatan Model No. 21-132 "Y" Type cast brass, or approved equal. Branding shall be marked "Standpipe".

   b. Each Double Clapper Siamese fixture shall come equipped with a ¾" sill cock to be located on the underneath side of the fixture, Powhatan Model No. 23-221 cast brass, or approved equal.

   c. As noted on the plans, each Standpipe System shall have one or more Roof Manifolds noted as either "Y" Type, two way, 4"x2½"x2½" Powhatan Model No. 20-363 cast brass or approved equal or "90°" Type, two way, 4"x2½"x2½" Powhatan Model No. 20-365 cast brass, or approved equal.

   d. Each fixture supplied shall be furnished complete with the necessary caps, plugs and attachment chains.

   e. All Fire Department Connections shall be threaded with the City of Richmond Fire Department standard thread.

   f. Roof Manifolds shall be supplied with Underwriters Approved Valves Powhatan Model No. 18-157 cast brass, or approved equal.

   g. All fire department fixtures and their accessories shall be rated for a minimum working pressure of 300 psi.

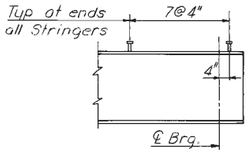
SHEAR STUD DETAIL
Not to Scale



DETAIL "A"
Not to Scale

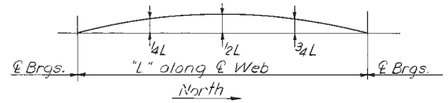
SHEAR STUD NOTE:

Capacity = 3400lbs. per stud.

The contractor may, if he elects, use three ⅞" diameter studs of the same longitudinal spacing in lieu of four ¾" diameter studs shown.

Stud rows shall be placed parallel to the main deck reinforcing.

Shear stud spacing shown is maximum spacing.



CAMBER DIAGRAM

NOTE TO FABRICATOR:

Stringers fabricated with an upward camber amounting to (see table). This will provide approximate compensation for deflection under full dead load.

FIXED SHOE

Note:
Anchor Bolt for Fixed Shoes same as Anchor Bolt for Exp. Shoes except as shown.

FIXED SHOE
No Scale

Shoe Notes:

Top of masonry plates, bottom of rocker plates and top and bottom of sole plates planed, straightened or otherwise treated to secure true level surfaces.

Contact surfaces noted on the plans with finish symbols shall be finished in accordance with the American National Standards Institute surface roughness requirement, as defined in ASA B46.1 Surface Roughness, Waviness and Lay, Part I.

The plates comprising the expansion shoes shall be set so as to be truly centered under full dead load at a temperture of 68°F.

Concrete pads shall be formed integral with abutment or pier and not less than ⅛" or more than ¼" above finished elevation. Dress down pads by rubbing, grinding or as otherwise approved by the Engineer, to true level surfaces at the finished elevation.

Anchor bolt assemblies shall conform to A.S.T.M. A-307 and shall be hot-dip galvanized conforming to A.S.T.M. A-153.

Templates shall be used to accurately set the anchor bolts.

Material for shoes (exclusive of self-lubricating plates) shall be high strength low alloy structural steel conforming to A.S.T.M. Specification A-588.

Material for self-lubricating plates shall be Leaded Tin Bronze conforming to A.S.T.M. Specification B22, alloy D modified to the extent that 1.5 to 2.5 percent lead is allowable.

Shoes shall be included with structural steel item for payment.

ANGLE SUPPORT AT ABUTMENT JOINTS
Scale: 1 1/2"=1'-0"

NOTES:

The size of the joint opening indicated on the plans is for a temperature of 68°F. Actual joint openings take into account the temperature at the time of construction.

Joint angles set to provide the specified opening after the concrete deck for the unit has been placed to 5 feet from the joint. The concrete deck for a distance of 5 feet on either side of the joint placed and finished after final adjustment and bolting of the joint supports completed.

Joint openings in the parapet accurately formed and constructed to smooth, straight lines. 2

Attachment of the studs to the joint angle made by full penetration butt welds.

Joint angles, studs and supports furnished and installed under the [redacted] Item "Structural Steel." 2

No separate payment made for furnishing and installing preformed neoprene joint sealers, but the cost thereof included in the price bid for "Concrete, Class A4."

DEAD LOAD DEFLECTION DIAGRAM
NO SCALE

NOTE TO CONTRACTOR

The deflections noted are those anticipated to occur in the stringer upon placement of the total concrete dead load. In practice the stringers, in place, are not likely to have the exact camber to compensate for these deflections during construction. The residual amounts shall be provided for by adjusting forms to vary the thickness of the concrete between the bottom of the slab & the top of stringer, without alteration of the slab thickness.

⚠1

Note "A"
"A" Dimension is given at the intersection of the ℄ Stringer and ℄ Bearing. Dimension shown is measured from top of top flange to construction joint for Fascia Stringers with 1'-9" overhang (see deck plan) and from top of top flange to top of deck for all other stringers. This dimension may vary between bearings due to change in top flange thickness or Variation in Camber, except that no portion of the stringer flange may fall within the slab.

ANCHOR BOLT DETAIL
No Scale

NOTES:

Fill slots and holes in masonry plate around anchor bolts with a nonhardening caulking compound or elastic joint sealer.

For expansion bearing, bevel sole plate to match grade.

Steel in bearing may be ASTM A36, A572, Grade 50, or A588 and shall be painted. Surface of sole plate and masonry plate in contact with bronze plates shall not be painted, but coated with multipurpose grease before shipment. Prior to assembly in place these surfaces shall be thoroughly coated with additional antioxidant lubricant furnished by the manufacturer.

Radius may be machined to compensate for grade.

Bearing shall be set so that at 68°F, it is at the midpoint of its movement.

For Expansion bearing, 15° Radius tolerances:
Sole Plate -.0" +.01"
Bronze Plate -.01" +.0"

SOUTHBOUND ROADWAY

NORTHBOUND ROADWAY

* Existing deck elevations

NOTES:

Elevations of existing deck are from field survey. Horizontal and vertial dimensions are based on As-Built Plans and included with this set of plans as Reference Plans. It shall be the Contractor's responsibility to verify all pertinent elevations and dimensions of the existing structure prior to construction and the fabrication of any Structural Steel.

The contractors attention is directed to the approximate locations of utilities as shown on the General Plan and Elevation.

The contractor shall submit to the engineer for approval, drawings for protection and maintenance of service of utilities, located in the areas adjacent to new footing to be constructed.

(SOUTHBOUND SHOWN)
Scale: 3/8" = 1'-0"

NOTE A:

Dimension shown is measured from top of web to top of slab at the intersection of the centerline of bearing and the centerline of girder.

This dimension may be varied between bearings as required to compensate for variations in camber, except that no portion of the girder flange may fall within the slab.

NOTES:

All bevels for concrete on this sheet shall be 3/4". Rounded edges with 1" radius may be used in lieu of bevels along top of parapet.

For groove location, see Deck Plan Sheets.

Precast Parapet shall not be used on this structure.

GENERAL NOTES

ROADWAY: One 28'-0" clear roadway. Two 5'-0" sidewalks.

CAPACITY: Dead Load includes 15 lbs. per sq. ft. for future wearing surface.
Live Loads - HS20-44 loading.

SPECIFICATIONS:
GENERAL: Virginia Department of Highway Road and Bridge Specifications 1970.
DESIGN: A.A.S.H.O. Standard Specifications for Highway Bridges 1961, modified by Special Design Provisions.
WELDING: 1969 Standard Specifications for Welded Highway and Railway Bridges of the American Welding Society.

CONTRACT SPECIAL PROVISIONS
Specifications and Contract Special Provisions referred to above are necessary to make these plans complete.

DATUM: City of Richmond

TEMPERATURE: The normal temperature referred to on the plan is 68°F. The temperature range for movement is 0°F to 120°F.

DIMENSIONS: All dimensions are measured horizontally and vertically unless otherwise noted.

EXCAVATION: Excavation below subgrade and cut slope template shall be classified as Structure Excavation. All excavation above these limits shall be classified as Regular Excavation and is not included in the Structural Quantities.

FOUNDATIONS: Footings shall rest on firm material. Foundation material shall be dry and special attention is called to Section 401.05 of General Specifications and to the Contract Special Provisions, concerning preparation of foundations for footings.

CONCRETE NOTES: Concrete in superstructure shall be Class A4. All other concrete shall be Class A3. All exposed edges and corners shall have a ¾" chamfer or fillet unless otherwise noted. Care in the method of vibration, the use of low-slump concrete, and or other means shall be employed to prevent downgrade movement of newly placed slab concrete.
Finishing Concrete Surfaces: See the Standard Architectural Detail Sheets and the Contract Special Provisions for types and details.

All reinforcing steel shall conform to A.S.T.M. A615, Grade 40. All reinforcing bar dimensions on the detailed drawings are to centers of bars unless otherwise noted. Clear distance between reinforcing steel and face of concrete shall be as noted on the plans. All bar laps shall be 30 diameters of the smaller diameter bar unless otherwise noted.

STEEL NOTES: Structural steel shall conform to A.S.T.M. Specification A36 except as noted.
All field connections shall be made with high strength bolts. High strength bolts shall be ¾" diameter unless otherwise noted and shall conform to A.S.T.M. Specification A 325.

BENCH MARK: A-16 Copperweld rod N.W. of R.R. Bridge on Douglasdale. Elev. 213.60

⊕ Boring, denotes 2½"ϕ Cased hole

SHEAR STUD NOTE

Capacity = 3,400 lbs. per stud.
The contractor may, if he elects, use three ¾" diameter studs at the same longitudinal spacing in lieu of the four ¾" diameter studs shown.
Stud rows shall be placed parallel to the main deck reinforcing.
Shear stud spacing shown is maximum spacing.

Note:
Stringers having a total camber of less than 1" are not required to be shop cambered, but should be turned so that any mill tolerance deviation from straightness will be in the direction shown by the Camber diagram.
If stringers are not cambered distance top of stringers to top of slab will vary along the stringer in accordance with the offset dimensions shown in the Camber diagram, and with a minimum distance as shown in cross-section on Sheet 7.

GENERAL NOTES

ROADWAY CAPACITY: Variable width of roadway.
Dead Load includes 15 lbs. per sq. ft. for future wearing surface.

SPECIFICATIONS:
GENERAL: Virginia Department of Highway Road and Bridge Specifications 1970.
DESIGN: A.A.S.H.O. Standard Specifications for Highway Bridges 1961, modified by Special Design provisions.
WELDING: 1969 Standard Specifications for Welded Highway and Railway Bridges of the American Welding Society.

CONTRACT SPECIAL PROVISIONS
Specifications and Contract Special Provisions referred to above are necessary to make these plans complete.

DATUM: City of Richmond

TEMPERATURE: The normal temperature referred to on the plan is 68°F. The temperature range for movement is 0°F to 120°F.

DIMENSIONS: All dimensions are measured horizontally and vertically unless otherwise noted.

EXCAVATION: Excavation below subgrade and cut slope template shall be classified as Structure Excavation. All excavation above these limits shall be classified as Regular Excavation and is not included in the Structural Quantities.

FOUNDATIONS: Piles shall be driven to a minimum length corresponding to the approximate tip elevations shown on the Plans but in no case to less than a penetration affording the required safe bearing capacity noted on the Plans.

CONCRETE NOTES: Concrete in superstructure shall be Class A4. All other concrete shall be Class A3. All exposed edges and corners shall have a ¾" chamfer or fillet unless otherwise noted. Care in the method of vibration, the use of low-slump concrete, and or other means shall be employed to prevent downgrade movement of newly placed slab concrete.

STEEL NOTES: All reinforcing steel shall conform to A.S.T.M. A-615, Grade 40. All reinforcing bar dimensions on the detailed drawings are to centers of bars unless otherwise noted. Clear distance between reinforcing steel and face of concrete shall be as noted on the plans. All bar laps shall be 30 diameters of the smaller diameter bar unless otherwise noted.
Structural steel shall conform to A.S.T.M. Specification A36 except as noted. All field connections shall be made with high strength bolts. High strength bolts shall be ⅞" diameter unless otherwise noted and shall conform to A.S.T.M Specification A-325.

BENCH MARK: A-25 Copperweld rod S.-side of Thompson St. and Cary Road. Elev. 236.59.

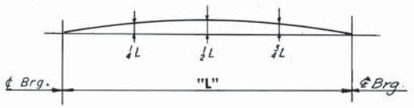
Note: Beam Ends, Bearing Stiffeners and Diaphragm Connections shall be plumb.



CAMBER DIAGRAM
No Scale

NOTE TO FABRICATOR

Stringers shall be fabricated with an upward camber amounting to the tabulated value.

This will provide approximate compensation for deflection under full dead load and for conformity with finished grade.

Stringers having a total camber of less than 1" are not required to be shop cambered, but should be turned so that any mill tolerance deviation from straightness will be in the direction shown by the Camber diagram.

If stringers are not cambered, distance top of stringers to top of slab will vary along the stringer in accordance with the offset dimensions shown in the Camber diagram, and with a minimum distance as shown in cross-section on Sheet 9.

S8	1/16"	⅛"	1/16"	⅜"	⅝"	⅜"	¼"	⅜"	¼"	1/16"	⅜"	¼"

NOTE TO CONTRACTOR

Deflections given are those anticipated to occur in the stringer upon placement of the total concrete deck dead load.

In practice, the stringers in place are not likely to have the exact camber to compensate for these deflections during construction. The residual amounts shall be provided by adjusting forms to vary the thickness of the concrete haunch between the bottom of the slab and the top of stringer, without altering the slab thickness.

SHEAR STUD NOTE

Capacity = 3,400 lbs. per stud.

The contractor may, if he elects, use three ⅞" diameter studs at the same longitudinal spacing in lieu of the four ¾" diameter studs shown.

Stud rows shall be placed parallel to the main deck reinforcing.

Shear stud spacing shown is maximum spacing.

* Spacing begins at termination of 7 spaces @ 4" as shown in Detail A.

Note: For Superstructure Structural steel quantities see Sheet 1.
For Standard Shoe details see Sheet 51.
For Framing details see Sheet 9.
For Joint details see Sheets 11 and 12.
This sheet must be worked with sheets 2, 3, 4, 6, ℄ 7.

IN CHARGE	W.E.O.		NO.	REVISION	BY	DATE

GENERAL NOTES:

ROADWAY CAPACITY: One 28'-0" Clear roadway. Two 8'-0" sidewalks. Dead Load - Includes 15lbs. per sq. ft. for future wearing surface. Live Loads - HS20-44 loading and B.P.R. modified for military vehicles.

SPECIFICATIONS:
GENERAL - Virginia Department of Highway Road and Bridge Specifications 1970
DESIGN - AASHO. Standard Specifications for Highway Bridges, 1961 modified by Special Design Provisions.
WELDING - 1969 Standard Specifications for welded Highway and Railway Bridges of the American Welding Society.

CONTRACT SPECIAL PROVISIONS:
Specifications and Contract Special Provisions referred to above are necessary to make these plans complete.

DATUM: CITY OF RICHMOND

TEMPERATURE: The normal temperature referred to on the plan is 60°F. The temperature range for movements is 0°F. to 120°F.

DIMENSIONS: All dimensions are measured horizontally and vertically unless otherwise noted.

EXCAVATION: Excavation below subgrade and cut slope template shall be classified as Structure Excavation. All excavation above these limits shall be classified as Regular Excavation and is not included in the Structural Quantities.

FOUNDATIONS: Footings shall rest on firm material. Foundation material shall be kept dry and special attention is called to section 401.05 of the General Specifications, and to the Contract Special Provisions, concerning preparation of foundations for footings.

CONCRETE NOTES:
Concrete in superstructure shall be Class A4. All other concrete shall be Class A3. All exposed edges and corners shall have a ¾" chamfer or fillet unless otherwise noted. Care in the method of vibration, the use of low slump concrete and/or other means shall be employed to prevent downgrade movement of newly placed slab concrete. (When gradient is over 2%)
Finishing concrete surfaces: See the Standard Architectural Detail Sheets and the Contract Special Provisions for types and details.

All reinforcing steel shall conform to ASTM A615 Grade 40. All reinforcing bar dimensions on the detailed drawings are to centers of bars unless otherwise noted. Clear distance between reinforcing steel and face of concrete shall be as noted on the plans. All bar laps shall be 30 diameters of the smaller diameter bar unless otherwise noted.

STEEL NOTES: Structural steel shall conform to A.S.T.M. Specification A36 except as noted.
All field connections shall be made with high strength bolts. High strength bolts shall be ⅞" diameter unless otherwise noted and shall conform to A.S.T.M. Specification A-325.

BENCH MARK: C-32. Monument located in walk S.W. Corner Idlewood and S. Randolph Sts. Elev. 192.25.

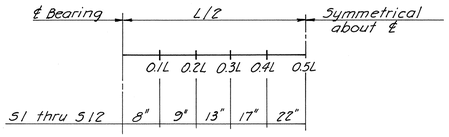
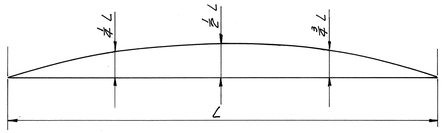
DETAIL "A"
No Scale



SHEAR STUD SPACING
No Scale
Shear Stud spacing shown is maximum

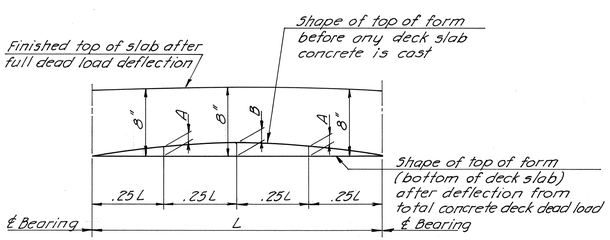
SHEAR STUD NOTES:
Capacity = 3400 lbs. per stud.
Three ⅞"ϕ Studs may be substituted at the same longitudinal spacing as shown for four ¾"ϕ Studs.
Stud rows to be placed perpendicular to ℄ Stringer.
For end condition, see "Detail "A"



CAMBER DIAGRAM

STRINGERS	¼ L	½ L	¾ L
51, 56	3"	4¾"	3 13/16"
52 thru 55	2 13/16"	4 9/16"	3 11/16"
57, 512	4 3/16"	5 ⅛"	4 3/16"
58 thru 511	4⅝"	5⅜"	4⅝"

NOTE TO FABRICATOR:
The above stringers shall be fabricated with an upward camber amounting to (see table). This will provide approximate compensation for deflection under full dead load and for conformity with finished grade.



DEAD LOAD DEFLECTION DIAGRAM

STRINGERS	A	B
51, 56, 57, 512	1⅜"	1 15/16"
52 thru 55, 58 thru 511	1¼"	1¾"

NOTE TO CONTRACTOR:
The above deflections are those anticipated to occur in the stringer upon placement of the total concrete deck dead load. In practice the stringers in place, are not likely to have the exact camber to compensate for these deflections during construction. The residual amounts shall be provided for by adjusting forms to vary the thickness of the concrete bolster between the bottom of the slab and the top of the stringer, without alteration of the slab thickness.

GENERAL NOTES

ROADWAY: One 25'-0" face to face of rail.

CAPACITY: Dead Load-Includes 15 lbs. per sq. ft. for future wearing surface. Live Loads-HS20-44 loading and B.P.R. modified for military vehicles.

SPECIFICATIONS:
GENERAL-Virginia Department of Highway Road and Bridge Specifications, 1970.
DESIGN-A.A.S.H.O. Standard Specifications for Highway Bridges, 1961, modified by Special Design Provisions.
WELDING-1969 Standard Specifications for welded Highway and Railway Bridges of the American Welding Society.

CONTRACT SPECIAL PROVISIONS

Specifications and Contract Special Provisions referred to above are necessary to make these plans complete.

DATUM: CITY OF RICHMOND

TEMPERATURE: The normal temperature referred to on the plan is 60°F. The temperature range for movement is 0°F. to 120°F.

DIMENSIONS: All dimensions are measured horizontally and vertically unless otherwise noted.

EXCAVATION: Excavation below subgrade and cut slope template shall be classified as Structure Excavation. All excavation above these limits shall be classified as Regular Excavation and is not included in the Structural Quantities.

FOUNDATIONS: Footings shall rest on firm material. Foundation material shall be kept dry and special attention is called to Section 401.05 of the General Specifications and to the Contract Special Provisions concerning preparation of foundations for footings.

CONCRETE NOTES:
Concrete in superstructure shall be Class A4. All other concrete shall be Class A3. All exposed edges and corners shall have a ¾" chamfer or fillet unless otherwise noted. Care in the method of vibration, the use of low-slump concrete, and or other means shall be employed to prevent downgrade movement of newly placed slab concrete. (When gradient is over 4%).

Finishing concrete surfaces: See the Standard Architectural Detail Sheets and the Contract Special Provisions for types and details.

All reinforcing steel shall conform to ASTM A615 grade 40. All reinforcing bar dimensions on the detailed drawings are to centers of bars unless otherwise noted. Clear distance between reinforcing steel and face of concrete shall be as noted on the plans. All bar laps shall be 30 diameters of the smaller diameter bar unless otherwise noted.

STEEL NOTES: Structural steel shall conform to A.S.T.M. Specification A36 except as noted.

All Field connections shall be made with high strength bolts. High strength bolts shall be ⅞" diameter unless otherwise noted and shall conform to A.S.T.M. Specification A-325. All shop welded web splices, flange splices and web to flange welds shall be made by the submerged arc process.

Notes:
Footings should be founded at the elevations shown on the plans unless otherwise directed by the Engineer due to conditions at the site during construction. In such cases, the Engineer will determine the extent of redesign necessary and will advise the Contractor before construction begins.
If difficulties arise during the driving of the steel piles due to the encountering of underground obstructions, the Contractor will be required to advance through the obstruction by spudding, drilling or some other suitable means and then proceed to redrive the pile to approximately the tip elevations given.
All piles shall be 10 BP42 Steel Piles (Design Capacity = 45 tons)

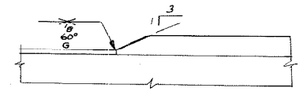
The stringers shall be fabricated with an upward camber amounting to the tabulated values. These values are in inches. This will provide approximate compensation for deflection under full dead load and for conformity with finished grade.
The deflections anticipated to occur in the stringer upon placement of the total concrete deck dead load are equal to the sum of the values listed for "Slab" and "Curb and Parapet".
Deviations from exact camber of the stringers shall be provided for by adjusting forms to vary the thickness of the concrete bolster between the bottom of the slab and the top of the stringers.



SHOP FLANGE SPLICE DETAILS

① The first two spaces at the ends of the stringers shall be one-half of the remaining spaces.

② Stiffeners shall be relocated as required to clear web splice plates.

③ See Shear Stud Details At End Bearings.

GENERAL NOTES:

WIDTH: WIDENING OF 7'-0" TO THE SOUTH OF THE EXISTING STRUCTURE.

SPAN LAYOUT: 100.5'-77' CONTINUOUS STEEL PLATE GIRDER SPANS.

CAPACITY: HS20-44 LOADING AND ALTERNATE MILITARY LOADING. DESIGN LOADING INCLUDES 15 PSF FOR FUTURE WEARING SURFACE AND 20 PSF ALLOWANCE FOR CONSTRUCTION TOLERANCES AND CONSTRUCTION METHODS.

SPECIFICATIONS:

CONSTRUCTION: VIRGINIA DEPARTMENT OF TRANSPORTATION ROAD AND BRIDGE SPECIFICATIONS, 1987.

DESIGN: AASHTO STANDARD SPECIFICATIONS FOR HIGHWAY BRIDGES, 1989, INCLUDING INTERIM SPECIFICATIONS, 1990 AND VDOT MODIFICATIONS.

STANDARDS: VIRGINIA DEPARTMENT OF TRANSPORTATION ROAD AND BRIDGE STANDARDS, 1989.

ALL DIMENSIONS ARE MEASURED HORIZONTALLY AND VERTICALLY UNLESS OTHERWISE SPECIFIED.

THESE PLANS ARE INCOMPLETE UNLESS ACCOMPANIED BY THE SUPPLEMENTAL SPECIFICATIONS AND SPECIAL PROVISIONS INCLUDED IN THE CONTRACT DOCUMENTS.

THE USE OF STAY-IN-PLACE FORMS WILL NOT BE PERMITTED.

ALL STRUCTURAL STEEL SHALL BE ASTM A36, EXCEPT AS NOTED.

CONCRETE IN SUPERSTRUCTURE SHALL BE CLASS A4. ALL OTHER CONCRETE SHALL BE CLASS A3.

DEFORMED REINFORCING BARS SHALL CONFORM TO ASTM A615, GRADE 60. ALL REINFORCING BAR DIMENSIONS ON THE DETAILED DRAWINGS ARE TO CENTERS OF BARS EXCEPT WHERE OTHERWISE NOTED AND ARE SUBJECT TO FABRICATION AND CONSTRUCTION TOLERANCES.

H-PILES HAVE A DESIGN CAPACITY OF 45 TONS PER PILE, AND SHALL BE DRIVEN TO REFUSAL.

PRIOR TO THE COMMENCEMENT OF ANY WORK THE CONTRACTOR SHALL FIELD VERIFY ALL DIMENSIONS AND ELEVATIONS OF THE EXISTING STRUCTURE AND REPORT TO THE ENGINEER ANY DISCREPANCIES BETWEEN FIELD MEASUREMENTS AND MEASUREMENT SHOWN ON THE CONTRACT PLANS.

THE CONTRACTOR SHALL COORDINATE CONSTRUCTION OF RETAINING WALL NO. 2 WITH THE BRIDGE B62 CONTRACTOR.

DEAD LOAD DEFLECTION DIAGRAM

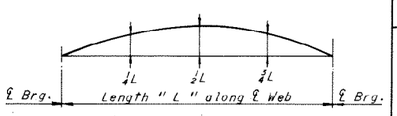
NOTE TO CONTRACTOR

Deflections given are those anticipated to occur in the stringer upon placement of the total concrete deck dead load.

In practice, the stringers in place are not likely to have the exact camber to compensate for these deflections during construction. The residual amounts shall be provided by adjusting forms to vary the thickness of the concrete haunch between the bottom of the slab and the top of stringer without altering the slab thickness.



CAMBER DIAGRAM

NOTE TO FABRICATOR

The stringers shall be fabricated with an upward camber amounting to the tabulated value. This will provide approximate compensation conformity with finished grade.

Dimensions are in inches.

(-) Sign in camber denotes downward camber.

GENERAL NOTES:

ROADWAY: One variable width roadway transitioning from a widening of Southbound roadway of Richmond-Petersburg turnpike to a ramp with 25'-0" clear roadway connecting with W.B. Roodway (Br. 63).

CAPACITY: Dead load includes 15 lbs. per sq. ft. for future wearing surface. Live load. HS 20-44 loading and alternate mtlitary loading.

SPECIFICATIONS:
GENERAL: Virginia Department of Highway Road and Bridge Specifications 1970.
DESIGN: A.A.S.H.O. Standard Specifications for Highway Bridges 1973, modified by Special Design provisions.
WELDING: 1972 Standard Specifications for Welded Highway and Railway Bridges of the American Welding Society.
CONTRACT SPECIAL PROVISIONS
Specifications and Contract Special Provisions referred to above are necessary to make these plans complete.

DATUM: City of Richmond

TEMPERATURE: The normal temperature referred to in the plans is 60°F. The temperature range for movement is 0° F. to 120° F.

DIMENSIONS: All dimensions are measured horizontally and vertically unless otherwise noted.

EXCAVATION: Excavation below subgrade and cut slope template shall be classified as Structure Excavation. All excavation above these limits shall be classified as Regular Excavation and is not included in the Structural Quantities.

FOUNDATIONS: Footings shall rest on firm material. Foundation material shall be dry and special attention is called to Section 401.05 of Standard Specifications and to the Contract Special Provisions, concerning preparation of foundations for footings.

CONCRETE NOTES: Concrete in superstructure shall be Class A 4. All other concrete shall be Class A 3. All exposed edges and corners shall have a ¾" chamfer or fillet unless otherwise noted. Care in the method of vibration, The use of low-slump concrete, and orother means shall be employed to prevent downgrade movement of newly placed slab concrete. Finishing Concrete Surfaces: See Standard Architectural Detail Sheets and the Contract Special Provisions for types and details. All reinforcing bar dimensions on the detailed drawings are to centers of bars unless otherwise noted. Clear distance between reinforcing steel and face To concrete shall be as noted on the plans. All bar laps shall be 30 diameters of the smaller diameter bar unless otherwise noted. All reinforcing steel shall conform to ASTM A615 Grade 40.

STEEL NOTES: Structural steel shall conform to A.S.T.M. Designations A36, A572 - Grade 50 and A588 as noted. See Special Provisions.
All field connections shall be made with high strength bolts. High strength bolts shall be ⅞" diameter unless otherwise noted and shall conform to A.S.T.M. Specification A-325.

Note:
For Curve Data and Profile Grade, see Sheet 1.
For Layout Plan, see Sheet 3.

SECTION G-G

Scale: ⅜"=1'-0"

Note: 30WF99 Bearing Beam to be set level on a pad prepared as required for shoes. Provide 8-#6 anchors hook into new concrete.

Note: Dimensions given to tie the new structure to the existing are based on the drawings for the original construction. The Contractor shall therefore verify all necessary dimensions of existing structural work.

Note: Elevation 79.81 @ top of existing Pier 92 is based on the original construction plans. If Elevation established in field is found to exceed 79.81 the concrete surface on top of Pier 92 is to be chipped and finished as required for shoes. If below, the difference is to be added to the nominal thickness of bearing plates under the shoes. All elevations of existing steel structures are to be verified in field by contractor.

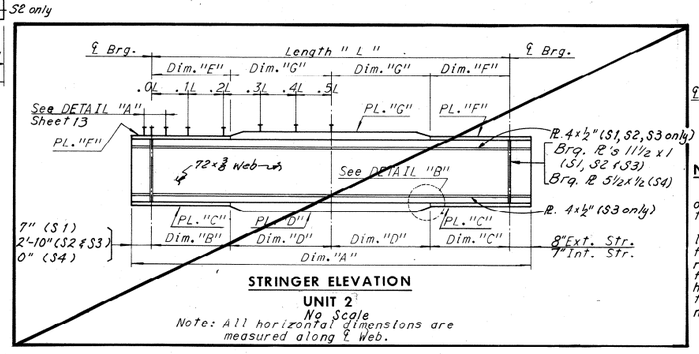
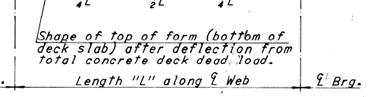
DETAIL "B"
No Scale



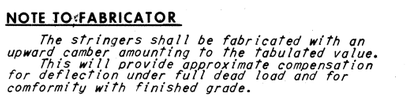
STRINGER ELEVATION
UNIT 2
No Scale
Note: All horizontal dimensions are measured along ℄ Web.



DEAD LOAD DEFLECTION DIAGRAM

NOTE TO CONTRACTOR

Deflections given are those anticipated to occur in the stringer upon placement of the total concrete deck dead load.
In practice, the stringers in place are not likely to have the exact camber to compensate for these deflections during construction. The residual amounts shall be provided by adjusting forms to vary the thickness of the concrete haunch between the bottom of the slab and the top of stringer without altering the slab thickness.



CAMBER DIAGRAM

NOTE TO FABRICATOR

The stringers shall be fabricated with an upward camber amounting to the tabulated value.
This will provide approximate compensation for deflection under full dead load and for comformity with finished grade.

Note:
Stringers having a total camber of less than 1" are not required to be shop cambered, but should be turned so that any mill tolerance deviation from straightness will be in the direction shown by the Camber Diagram.
If stringers are not cambered distance top of stringers to top of slab will vary along the stringer in accordance with the offset dimensions shown in the Camber Diagram, and with minimum distance as shown in Cross-Section on Sheet 17

⊕ Except as shown otherwise

Note:
Intermediate stiffener P.s 4½x⅜" shall be equally spaced between diaphragms ~~@ as shown~~. The first two stiffener spaced at the ends of stringers shall be one-half normal spacing within the panel.
It may be necessary to increase Bearing Stiffener size to accommodate erection of end diaphragm.

Note:
For Deck Plan, see Sheet 19.
For Joint Details, see Sheets 18 & 25
For Joint Details of Pier 10W, see Sheet 42, Bridge 67.
For Standard Shoe Details, see Sheet 51.
For Details of FB 14 and FB 15, see Sheet 18.
See Sheet 4 for special modifications of masonry plate, FBM @ Pier 1.
For Section H-H, see Sheet 19.
For Horizontal Stiffener Detail and Flange to Web Welds, see Sheet 15.

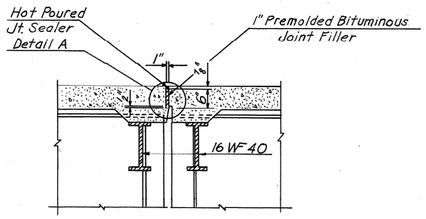
NOTES FOR FILLED JOINTS:

Joints shall be free of cracked and spalled areas and their faces shall be free of all foreign matter, curing compound, oils, greases and dirt. All faces must be sandblasted or brushed with a mechanical rotary wire brush. Just prior to sealing, the joint shall be blown out with oil-free and water-free compressed air.



TYPICAL SECTION THRU 1" FIXED JOINT
Scale: ½"=1'-0"

Note:
Joint filler material and copper flashing to be included in price bid for Superstr. Concrete

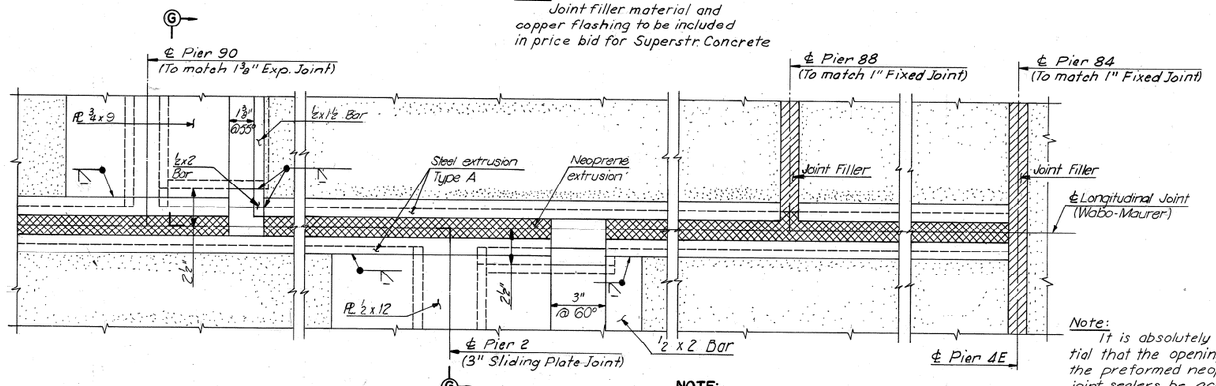
2⅝" TYPE "A" JOINT

EXPANSION JOINT DETAILS



PLAN - LONGITUDINAL JOINT
Scale: 3"=1'-0"

NOTE:
For Plan of Pier 3 & existing Pier 86, see Sheet 25.

Note:
It is absolutely essential that the openings for the preformed neoprene joint sealers be accurately formed and constructed to smooth, straight lines. The size of opening shall be adjusted to allow for anticipated dead load rotation of the ends of the slab and for the temperature at the time of construction.

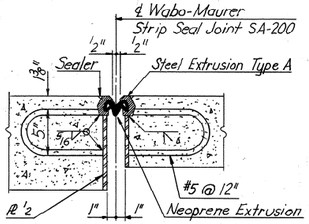
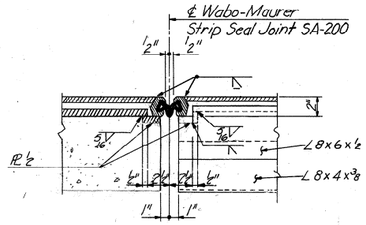
NOTES FOR WABO-MAURER JOINT:

Do not use steel extrusions as screed support.
Steel extrusion shall conform to ASTM A 36.
Structural steel shall conform to ASTM A 588.
Steel assembly shall be shop welded to convenient lengths and butt welded in the field to desired length. Joint shall conform to grade of deck slab.
Steel assembly shall be sandblasted in the shop prior to painting.
Steel assembly shall receive one shop coat of epoxy zinc paint.

Neoprene extrusion shall be roughened with a wire brush before bonding to steel extrusion with Bon Lastic Adhesive. Groove in steel extrusion to be blown out with oil-free and water-free compressed air prior to installation of Neoprene extrusion.
The Wabo-Maurer joint assembly shall be installed in accordance with manufacturer's recommended construction methods.



TYPICAL SECTION THRU WABO-MAURER JOINT
Scale: 1½"=1'-0"



SECTION G-G
Scale: 1½"=1'-0"

NOTE: Steel extrusion of Wabo-Maurer Joint to rest & Slide on PL ½.

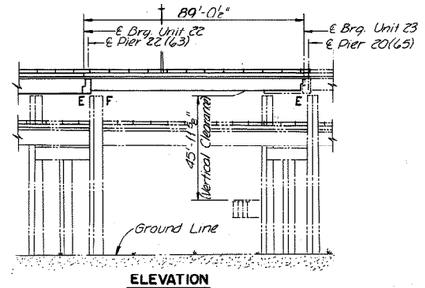
PLAN



ELEVATION

GENERAL NOTES:

ROADWAY: One variable width roadway transitioning from E.B. Roadway Downtown Expressway and Ramp 10th-E into Ramps W-N and W-S (Bridges No. 67 and 68)

CAPACITY: Dead load includes 15 lbs. per sq. ft. for future wearing surface. Live load. HS 20-44 loading and alternate military loading.

SPECIFICATIONS:
GENERAL: Virginia Department of Highway Road and Bridge Specifications 1970
DESIGN: A.A.S.H.O. Standard Specifications for Highway Bridges 1973 modified by Special Design provisions.
WELDING: 1972 Structural Welding Code of the American Welding Society

CONTRACT SPECIAL PROVISIONS
Specifications and Contract Special Provisions referred to above are necessary to make these plans complete

DATUM: City of Richmond

TEMPERATURE: The normal temperature referred to in the plans is 60°F. The temperature range for movement is 0°F to 120°F.

DIMENSIONS: All dimensions are measured horizontally and vertically unless otherwise noted.

EXCAVATION: Excavation below subgrade and cut slope template shall be classified as Structure Excavation. All excavation above these limits shall be classified as Regular Excavation and is not included in the Structural Quantities.

FOUNDATIONS: Footings shall rest on firm material. Foundation material shall be dry and special attention is called to Section 401.05 of General Specifications and to the Contract Special Provisions, concerning preparation of foundations for footings.

CONCRETE NOTES: Concrete in superstructure shall be Class A-4. All other concrete shall be Class A-3. All exposed edges and corners shall have a ¾" chamfer or fillet unless otherwise noted. Care in the method of vibration, the use of low-slump concrete, and or other means shall be employed to prevent downgrade movement of newly placed slab concrete. Finishing Concrete Surfaces: See Standard Architectural Detail Sheets and the Contract Special Provisions for types and details. All reinforcing steel shall be deformed bars conforming to ASTM A615 Grade 40. All reinforcing bar dimensions on the detailed drawings are to centers of bars unless otherwise noted. Clear distance between reinforcing steel and face of concrete shall be as noted on the plans. All bar laps shall be 30 diameters of the smaller diameter bar unless otherwise noted.

STEEL NOTES: Structural steel shall conform to A.S.T.M. Designations A36, A572 - Grade 50 and A588 as noted. See Special Provisions.
All field connections shall be made with high strength bolts. High strength bolts shall be ⅞" diameter unless otherwise noted and shall conform to A.S.T.M. Specification A-325.

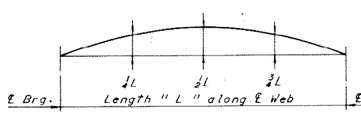
DEAD LOAD DEFLECTION DIAGRAM

NOTE TO CONTRACTOR

Deflections given are those anticipated to occur in the stringer upon placement of the total concrete deck dead load.

In practice, the stringers in place are not likely to have the exact camber to compensate for these deflections during construction. The residual amounts shall be provided by adjusting forms to vary the thickness of the concrete haunch between the bottom of the slab and the top of stringer without altering the slab thickness.



CAMBER DIAGRAM

NOTE TO FABRICATOR

The stringers shall be fabricated with an upward camber amounting to the tabulated value.

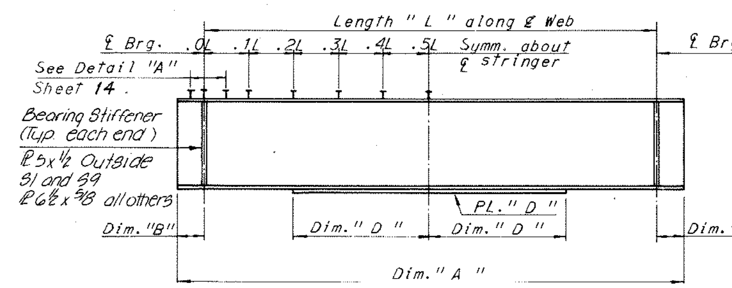
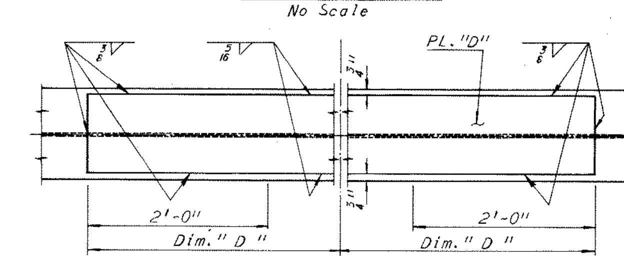
This will provide approximate compensation for deflection under full dead load and for comformity with finished grade.

Dimensions are in inches.



STRINGER ELEVATION
No Scale



COVER PLATE DETAIL
No Scale

Note:
Stringers having a total camber of less than 1" are not required to be shop cambered, but should be turned so that any mill tolerance deviation from straightness will be in the direction shown by the Camber Diagram.

If stringers are not cambered, distance top of stringers to top of slab will vary along the stringer in accordance with the offset dimensions shown in the Camber Diagram, and with minimum distance as shown in cross-section on Sheet 29.

DEAD LOAD DEFLECTION DIAGRAM

NOTE TO CONTRACTOR

Deflections given are those anticipated to occur in the stringer upon placement of the total concrete deck dead load.
In practice, the stringers in place are not likely to have the exact camber to compensate for these deflections during construction. The residual amounts shall be provided by adjusting forms to vary the thickness of the concrete haunch between the bottom of the slab and the top of stringer without altering the slab thickness.

CAMBER DIAGRAM

NOTE TO FABRICATOR

The stringers shall be fabricated with an upward camber amounting to the tabulated value. This will provide approximate compensation for deflection under full dead load and for conformity with finished grade.
Dimensions are in inches.
Stringers having a total camber of less than 1" are not required to be shop cambered, but should be turned so that any mill tolerance deviation from straightness will be in the direction shown by the Camber Diagram.
If stringers are not cambered, distance top of stringers to top of slab will vary along the stringer in accordance with the offset dimensions shown in the Camber Diagram, and with minimum distance as shown in cross-section on Sheet 32.

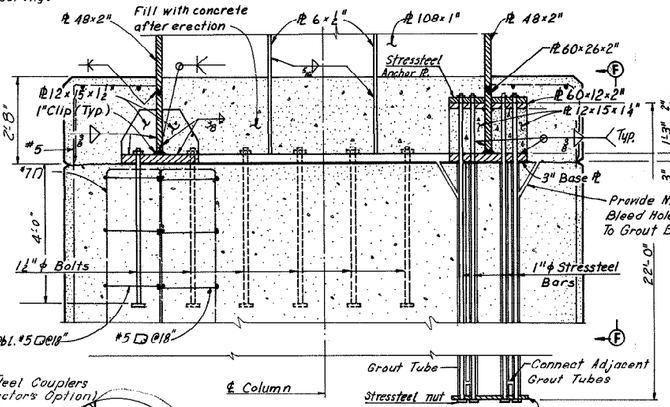
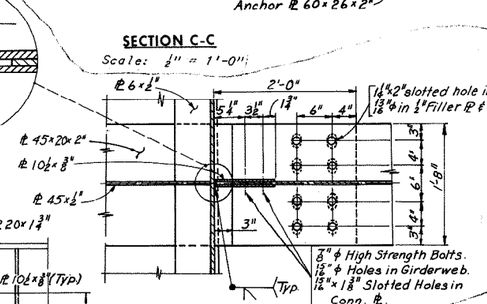
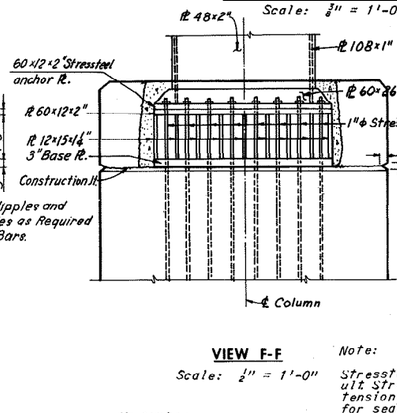
SECTION E-E SECTION J-J
Scale: 3/8"=1'-0"



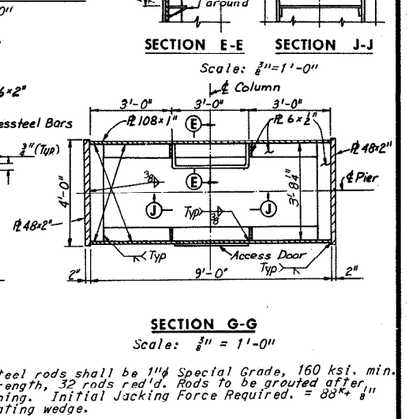
SECTION C-C
Scale: ½" = 1'-0"



SECTION 1-1
Scale: 1"=1'-0"



VIEW F-F
Scale: ½" = 1'-0"



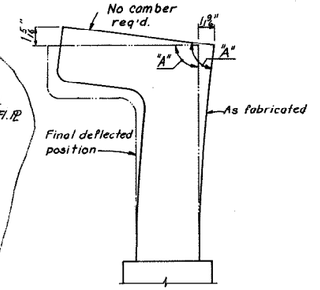
SECTION G-G
Scale: 3/8" = 1'-0"

Note:
Stressteel rods shall be 1"ϕ Special Grade, 160 ksi. min. ult Strength, 32 rods req'd. Rods to be grouted after tensioning. Initial Jacking Force Required. = 88^k @ 1" for sealing wedge.

Rods shall be tensioned as outlined in the construction sequence. Rods need not be tensioned in pairs, However, tensioning shall proceed outward from the centerline of Pier 10.

Rods of the first group shall be checked in the same sequence as initial tensioning, checking shall continue until two successive 1"ϕ rods checked have a tension of at least 80^k.

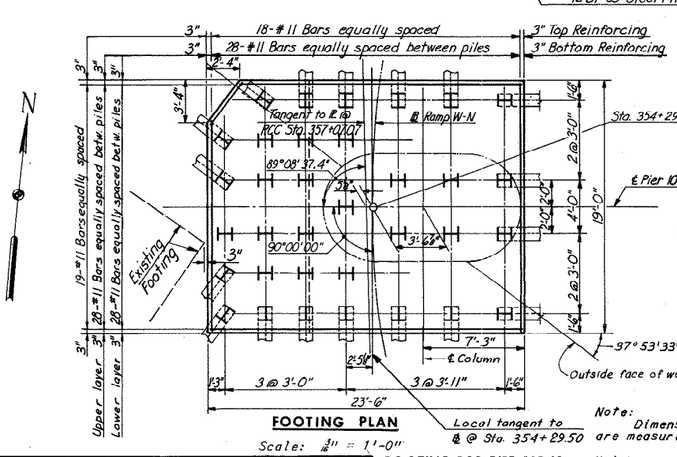
The contractor is cautioned against nicking the stress rods and he shall follow the manufacturers recommended handling procedures The contractor shall provide adequate safety measures. The contractor shall submit his proposed construction procedures to the engineer for approval.



CAMBERING OF COLUMN
No Scale

GENERAL CONSTRUCTION SEQUENCE:

1. Construct footing and pedestal including 32-1"ϕ stressteel bars.
2. Erect column and capbeam. Tighten down nuts on 1¼"ϕ anchor bolts. Stress 12 interior tensioning rods.
3. Erect structural steel superstructure in such a manner that load eccentricity on the column is kept at a minimum.
4. Stress 12 exterior tensioning rods.
5. Place concrete deck.
6. Stress remaining 8 tensioning rods.
7. Check tension on initial group of rods.
8. Cutoff rod extension. Fill column base with concrete, grout and encase base and anchorage with concrete.



FOOTING PLAN
Scale: 3/32" = 1'-0"

FOOTING FOR PIER 10E IS ECCENTRIC AS SHOWN ON FOOTING PLAN

Note:
Dimensions in Footing Plan are measured at bottom of Footing.

Note:
Footing elevations are approximate only and may be varied to suit field conditions as directed by the Engineer. Vertical shaft reinforcing shall not be cut until these elevations are established. Where elevations change more than 2 ft., redesign will be required.

S4-10	88.06	86.93	85.16	80.20	75.93	71.82

NOTE TO CONTRACTOR

Deflections given are those anticipated to occur in the stringer upon placement of the total concrete deck dead load.

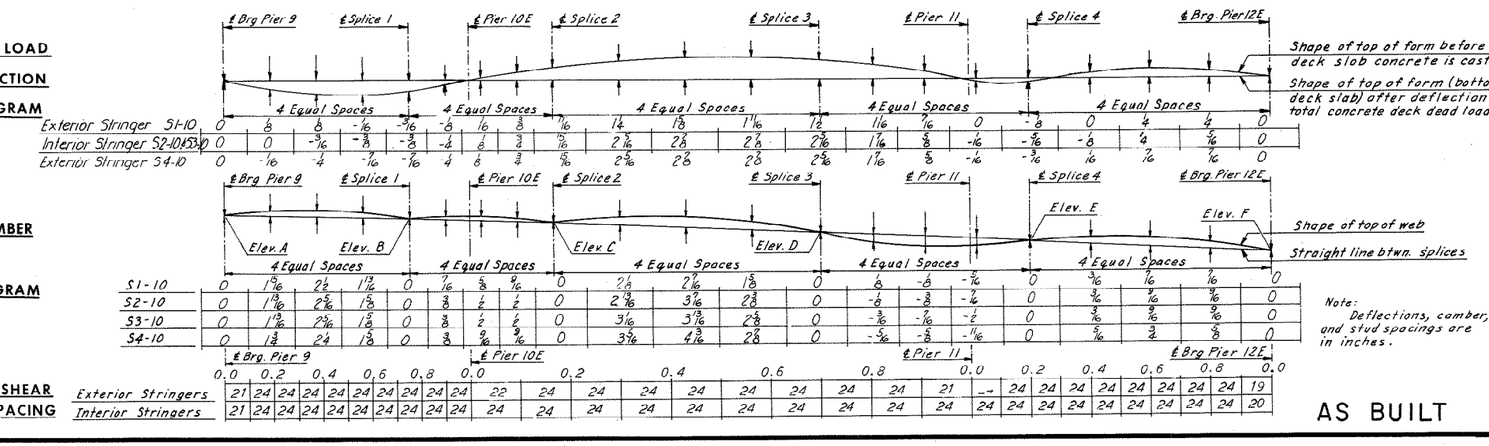
In practice, the stringers in place are not likely to have the exact camber to compensate for these deflections during construction. The residual amounts shall be provided by adjusting forms to vary the thickness of the concrete haunch between the bottom of the slab and the top of stringer without altering the slab thickness.

NOTE TO FABRICATOR

The stringers shall be fabricated with an upward camber amounting to the tabulated value. This will provide approximate compensation for deflection under full dead load and for comformity with finished grade.

Note:
Stringers having a total camber of less than 1" are not required to be shop cambered, but should be turned so that any mill tolerance deviation from straightness will be in the direction shown by the Camber Diagram.

If stringers are not cambered distance top of stringers to top of slab will vary along the stringer in accordance with the offset dimensions shown in the Camber Diagram, and with minimum distance as shown in Cross-Section on Sheet



Note:
For Deck Plan, see Sheet 34.
All Steel shall be A36 unless otherwise noted.
For Details not shown, see Section D-D, sheet 11 and Detail C, sheet 33.
For Web to Flange Weld size, see Note, Sheet 20.

Note:
Deflections, camber, and stud spacings are in inches.

LEGEND:

* Elevations of top of stringers and top of Floorbeam extended at ℄ Truss are taken at ℄ Floorbeam 0.

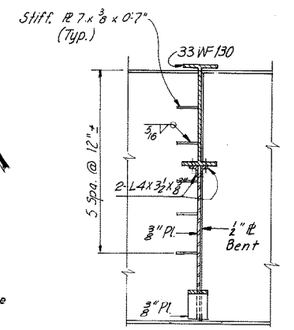
** Denotes Radial Dimension

Δ Dimensions are to projected ℄ Stringer at ℄ Floorbeam. Connection - Stiffener Plate shall be located by the Fabricator.

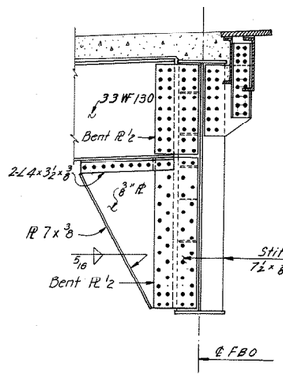
PLAN
Scale: ½"-1'-0"

SECTION A-A
ELEVATION-FLOORBEAM 0
Scale : ½" = 1'-0"

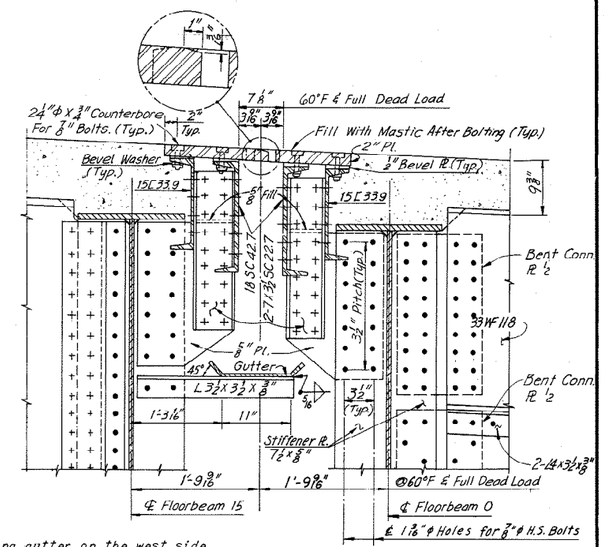
Note: Expansion plates and curb plates are omitted from Plan. For Elevation of Floorbeam 15, see Bridge 64 Sheet 18.



SECTION D-D
Scale: ½"= 1'-0"

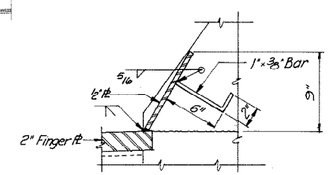


SECTION C-C
Scale: ½"=1'-0"

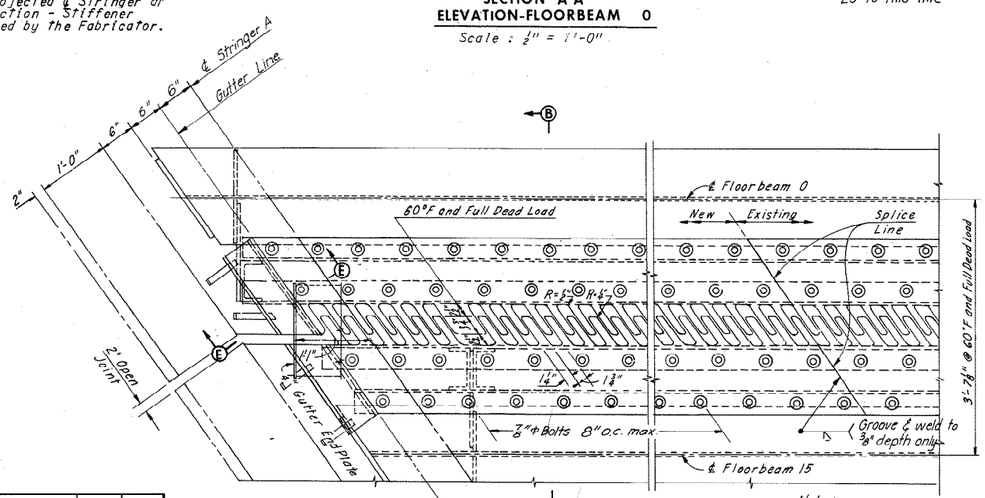


Note: Cut existing gutter on the west side of the existing stringer and set the new gutter into the existing gutter. Bolt the two together with existing bolts. Provide an 8" lap.

SECTION B-B
Scale: 1"=1'-0"



SECTION E-E
Scale : 1½"=1'-0"



PART PLAN OF EXPANSION DEVICE
Scale: 1" = 1'-0"

Note: Cut existing finger plate as close to the existing gutter line as possible. New plate shall be provided long ℄ cut to exact length after existing plate is cut.
